## MT WATSON DRILLING CAMPAIGN

### Highlights

- 12 holes of RC drilling on EPM15986 were completed at Mt Watson Project
- More than 1000 RC hole samples were collected
- Sample assaying is under way

Ishine International Resources Limited (**ASX Code: ISH “Ishine” or the “Company”**) is pleased to advise that Ishine’s Joint Venture partner, the 8<sup>th</sup> Institute of Geology and Mineral Exploration (“IGME”) has completed a 12 holes drilling program at the Mt Watson project site.

The 12 drill holes, of angled RC drilling, were based on a previously identified set of geological anomalies at the project site. Extensive pad preparation was carried out due to the location of the proposed drill sites, which was on a hill. A total of 1,174 metres was drilled as planned. Drilling depths ranged from 70metres, on a few difficult holes, to 160 metres. One sample per meter drilled was collected. More than 1,000 samples will be sent to labs for processing and assaying. Once the assay results are available, together with the drill logs, a detailed mapping analysis will be carried out.

The Company will advise shareholders once the results of the drilling are received from our JV partner.

Ishine has earned a 49% interest in Mt Watson and is in the process of earning up to 70% through this drilling program and future exploration activities from Kabiri Resources Pty Ltd.

The Mt Watson Project has two tenements EPM15933 and EPM15986 and is situated approximately 120km north of Mt Isa in northwest Queensland. The tenement covers an area of 63.6 km<sup>2</sup> in a district with extensive known copper mineralisation.
